

TASK 2 (1) SOLUTION

Google Search Functionality Test cases:

1. Validate that the search results displayed is relevant to search keyword
2. Validate that when user start typing in the search field, it should suggest words that matches typed keyword
3. Validate that there is a pre-defined search criterion for auto complete e.g. after typing first 3 letter it should suggest matching keyword
4. Validate that when user clicks on any link from result and navigates back, then result should be maintained
5. Validate that after clicking the Search field - search history is displayed (latest search keyword)
6. Validate that the History displayed in search field is relevant to logged in user only
7. Validate that pagination is enabled for searches returning high number of records
8. Validate that the total number of search records/results is displayed on page
9. Validate that the search keyword is highlighted with color in the search results
10. Validate that the pagination functionality works well
11. Validate that users can carry out searches by pressing the "Enter" key
12. Validate that nothing happens when user clicks on the search button without entering a keyword into the search field
13. Validate that the search text box is present on the home page
14. Validate that users can carry out a search from the result page
15. Validate that the search result displays relevant search result
